ENVIRONMENTAL PRODUCT DECLARATION
as per ISO 14025 and EN 15804

Owner of the Declaration | Desso BV
Programme holder | Institut Bauen und Umwelt e.V. (IBU)
Publisher | Institut Bauen und Umwelt e.V. (IBU)
Declaration number | EPD-DES-20130053-CBD1-EN
Issue date | 08/05/2013
Valid to | 07/05/2018

Tufted carpet tiles
Pile material 800-900 g/m² polyamide 6 with 0 % recycled content and a modified bitumen backing
Desso®

General Information

Desso®

Programme holder
IBU - Institut Bauen und Umwelt e.V.
Rheinufer 108
D-53639 Königswinter

Declaration number
EPD-DES-20130053-CBD1-EN

This Declaration is based on the Product Category Rules:
Floor coverings, 07-2012
(PCR tested and approved by the independent expert committee)

Issue date
08/05/2013

Valid to
07/05/2018

Tufted carpet tiles
Pile material 800-900 g/m²
polyamide 6 with 0 % recycled content and a modified bitumen backing

Owner of the Declaration
Desso BV
Taxandriaweg 15
5142 PA Waalwijk,
The Netherlands

Declared product / Declared unit
1m² tufted carpet tiles with a surface pile of 800-900g/m² polyamide 6 and a modified bitumen backing.

Scope:
The declaration applies for a group of tufted modular carpet tiles.
It is only valid in conjunction with a valid PRODIS licence.
The products are produced in the manufacturing site Dendermonde, Belgium (tufting) and in Waalwijk, The Netherlands (precoating and heavy coating).
The owner of the declaration shall be liable for the underlying information and evidence.

Verification
The CEN Norm EN 15804 serves as the core PCR
Independent verification of the declaration and data according to ISO 14025

Prof. Dr.-Ing. Horst J. Bossenmayer
President of Institut Bauen und Umwelt e.V.

Prof. Dr.-Ing. Hans-Wolf Reinhardt
Chairman of SVA

Dr. Eva Schmincke
Independent tester appointed by SVA

Product

Product description
Tufted carpet tiles with a surface pile of solution-dyed polyamide 6 with 0% recycled content, and a modified bitumen backing.
The declaration applies for a group of products with a total pile-material input of 800-900 g/m². The calculations refer to the average pile-material input of 850 g.

Application
According to the use class as defined in EN 1307 the products can be used in all professional area which require class 33 or less.

**Reference service life**

The service life of textile floorcoverings strongly depends on the correct installation taking into account the declared use classification and the adherence of cleaning and maintenance instructions. A minimum service life of 10 years could be assumed, technical service life can be considerably longer.

**LCA: Calculation rules**

**System boundary**

*Type of the EPD:* Cradle to grave.

*System boundaries of the modules A, B, C, D:*

**A1-A3 Production:**
Energy supply and production of the basic material, processing of secondary material, auxiliary material, transport of the material to the manufacturing site, emissions, waste water treatment, packaging material and waste processing up to the landfill of residual waste (except radioactive waste). Credits for electricity and steam from the incineration of production waste are aggregated.

**A4 Transport:**
Transport of the packed textile floorcovering from manufacturing gate to the place of installation.

**A5 Installation:**
Installation of the textile floorcovering, production and transport of auxiliary material, waste processing up to the landfill of residual waste (except radioactive waste), the production of the amount of carpet that occurs as installation waste incl. its transport to the place of installation. Credits for electricity and steam from the incineration of installation waste leave the product system.

**B1 Use:**
Indoor emissions during the use stage. Due to known VOC-decay curves of the product after the first year no product related VOC-emissions are relevant.

**B2 Maintenance:**
Cleaning of the textile floorcovering for a period of 1 year:
- Vacuum cleaning – electricity supply

The declared values in this module have to be multiplied with the assumed service time of the floor covering in the building considered.

**B3 - B7:**
The modules are not relevant and therefore not declared.

**C1 De-construction:**
De-construction of the floorcovering is made by handcraft and causes no additional impacts.

**C2 Transport:**
Transport of the carpet waste to landfill, to the municipal waste incineration (MWI) or to the waste collection for recycling.

**C3 Waste processing:**
C3-0, C3-1: Landfill and waste incineration need no waste processing.
C3-2: Collection of the carpet waste, waste processing (granulating).

**C4 Disposal**
C4-0, C4-1: Impacts from landfill or from waste incineration (credits leave the system boundaries), C4-2: The processed carpet waste leaves the system and need no disposal.

**D Recycling potential:**
D-0, D-1: Energy credits from landfill and from waste incineration (processing with < 60% efficiency), D-2: Transport from the reprocessing plant to the cement plant, substitution of material and fuel input in the cement kiln (substantial and energetic credits).

**Comparability**

Basically, a comparison or an evaluation of EPD data is only possible if all the data sets to be compared were created according to EN 15804 and the building context, respectively the product-specific characteristics of performance, are taken into account.
LCA: Scenarios and additional technical information

The following information refer to the declared modules and are the basis for calculations or can be used for further calculations. All indicated values refer to the declared functional unit.

**Transport to the construction site (A4)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Further information on cleaning and maintenance see www.desso.com

**End of Life (C1-C4)**

Three different end-of-life scenarios are declared and the results are indicated separately in module C. Each scenario is calculated as a 100% scenario.

- Scenario 0: 100% landfill
- Scenario 1: 100% municipal waste incineration (MWI)
- Scenario 2: 100% recycling in the cement industry

If combinations of these scenarios have to be calculated this should be done according to the following scheme:

\[
\text{EOL-impact} = x\% \text{ impact (Scenario 0)} + y\% \text{ impact (Scenario 1)} + z\% \text{ impact (Scenario 2)}
\]

**Reuse, recovery and/or recycling potentials (D)**

*Recycling in the cement industry (scenario 2)*

The organic material of the carpet is used as secondary fuel in a cement kiln. It substitutes mainly lignite (62.7%), hard coal (27.3%) and petrol coke (10.0%). The inorganic material is substantially integrated in the cement clinker and substitutes original material input.

</table>
LCA: Results

Information on not declared modules:

The modules B3 - B7 are not relevant during the service time of the carpet and are therefore not declared. Module C1 causes no additional impact (see "LCA: Calculation rules", "C1 De-construction") and is therefore not declared. Module C2 represents the transport for scenario 0, 1 and 2.

DESCRIPTION OF THE SYSTEM BOUNDARY (X = INCLUDED IN LCA; MND = MODULE NOT DECLARED)

The modules B3 - B7 are not relevant during the service time of the carpet and are therefore not declared.

RESULTS OF THE LCA – RESOURCE USE: 1 m² floorcovering

RESULTS OF THE LCA – ENVIRONMENTAL IMPACT: 1 m² floorcovering

RESULTS OF THE LCA – OUTPUT FLOWS AND WASTE CATEGORIES: 1 m² floorcovering

The declared values in module B2 have to be multiplied with the assumed service time (in years) of the floor covering in the building considered.
